

An Introduction

My name is your name , and I live and work in Northwestern Ontario. I hold a degree in Recreation Management and Community Development from the University of Manitoba, with a minor in Indigenous Studies — so the question of who owns and controls community infrastructure is one I have been sitting with for a long time. I am not here with a proposal or a product to sell. I am here because I have been building something that I think belongs in a conversation with you, and I wanted to introduce myself before anything else.

The work is called Codetry. At its simplest, it is a practice for communities that want to name and build their own digital tools — and keep them. Not rely on outside platforms that can be taken away, priced out of reach, or changed without notice. Codetry is a method: a set of naming rules and structural boundaries that make sure each tool is understandable, teachable, and owned by the people who use it.

I built the first tools for my own household and a small circle of families here in Dryden. A homeschool companion that works without an internet connection. A chore and savings tracker for kids. A bulletin board for a community of sixty families that replaces overloaded group chats. Each one was scoped, named, and documented by the same discipline. Each one stays with the people who use it.

The capacity building piece is what brings me to this table. Too many communities — especially communities that have been managing their own land, trade, and governance for generations — are now running their households, circles, and economies on digital infrastructure that somebody else controls. Codetry is a way to change that from the inside. Not by importing a new vendor, but by building the knowledge and the tools together, in plain language, documented well enough that the next person in your community can carry it forward without me in the room.

What I am looking for is a conversation. I want to understand what your community is already managing, where the friction is, and whether there is a natural starting point we could build together. Not a transaction — a relationship. If there is a pilot that makes sense, we will find it together.
