

THE PREMISE

Codetry is a naming and structure discipline — a documented method for communities that want to design and run their own digital tools without depending on outside companies to maintain them. This pilot tests the method in a real partnership: one community, one scoped tool, one year to build and document it together.

The pilot does not produce a finished product for a client. It produces a community that owns something it built, understands how it works, and can teach the next person.

SCOPE

PARTNER

One community organization in Northwestern Ontario — ideally already engaged with local economic development, co-operative structure, or community food systems. Community name: community name

DURATION

Twelve months. Discovery and scoping in months one and two; build and test from month three through ten; documentation sprint in months eleven and twelve. No deliverable ships until your community has shaped it.

DELIVERABLE

One Codetry-scoped tool built together with your community and documented well enough that a second community could replicate it without additional help. Tool scope is chosen with the community — not for them.

PILOT TIMELINE

PHASE 1

Months 1–2

Discovery

- Community listening sessions
- Tool scoping using Codetry zones
- Naming workshop — Saltbox + Both-States test
- Shared written scope agreement

PHASE 2

Months 3–6

Build

- Iterative builds with community feedback loops
- Weekly check-ins with community point of contact
- Both-States test on each feature before ship
- Community member(s) reviewing every sprint

PHASE 3

Months 7–10

Test & Transfer

- Live use within the partner community
- Issue triage with community lead
- Knowledge transfer — community can run it independently
- Identify the person who teaches the next person

PHASE 4

Months 11–12

Document

- Replication guide written for a second community
- Naming workbook — every decision recorded
- Final report to funder
- Community presents their own tool at close

COMMUNITY OWNERSHIP — FIRST-CLASS OUTCOME

At the close of the pilot, your community owns the tool outright — code, data, documentation, and domain. There is no licensing fee, no vendor lock-in, and no dependency on Codetry continuing to exist as an organization.

The replication guide is the second deliverable. A community that built one tool with Codetry has what it needs to scope and build the next one on its own. That guide is available to any community that asks for it.

WHAT THE COMMUNITY HOLDS AT CLOSE

- The tool — running, maintained, theirs
- The code — in a repository they control
- The documentation — written for the next community
- The name — chosen by their own process
- The knowledge — at least one person who can teach it
